ABSTRACT OF THE DISCLOSURE

There is a film-press spring for pressing a photographic film on a take-up spool in a take-up chamber. The film-press spring has a main body for guiding a leading end of the photographic film at the beginning of the film winding and a plate bended in U-shape against the main body. A pressing arm which is protruded from the main body presses the photographic film to a periphery of the take-up spool. And a fitting arm which is elastic enough to be transformed is protruded from the plate. When inserted into the spring attachment hollow of the take-up chamber, the fitting arm presses the wall surface of the spring attachment hollow. And a slipping prevention claw of the plate is engaged with the wall surface of the spring attachment hollow.
